## QUESTIONS AND TOPICS

- Is a computer algorithm able to find news topics from open data in the internet ?
- Searching news from social media
- How much of the editors' work (news authoring) can be done automatically by computer ?
- Commercial applications of results ?

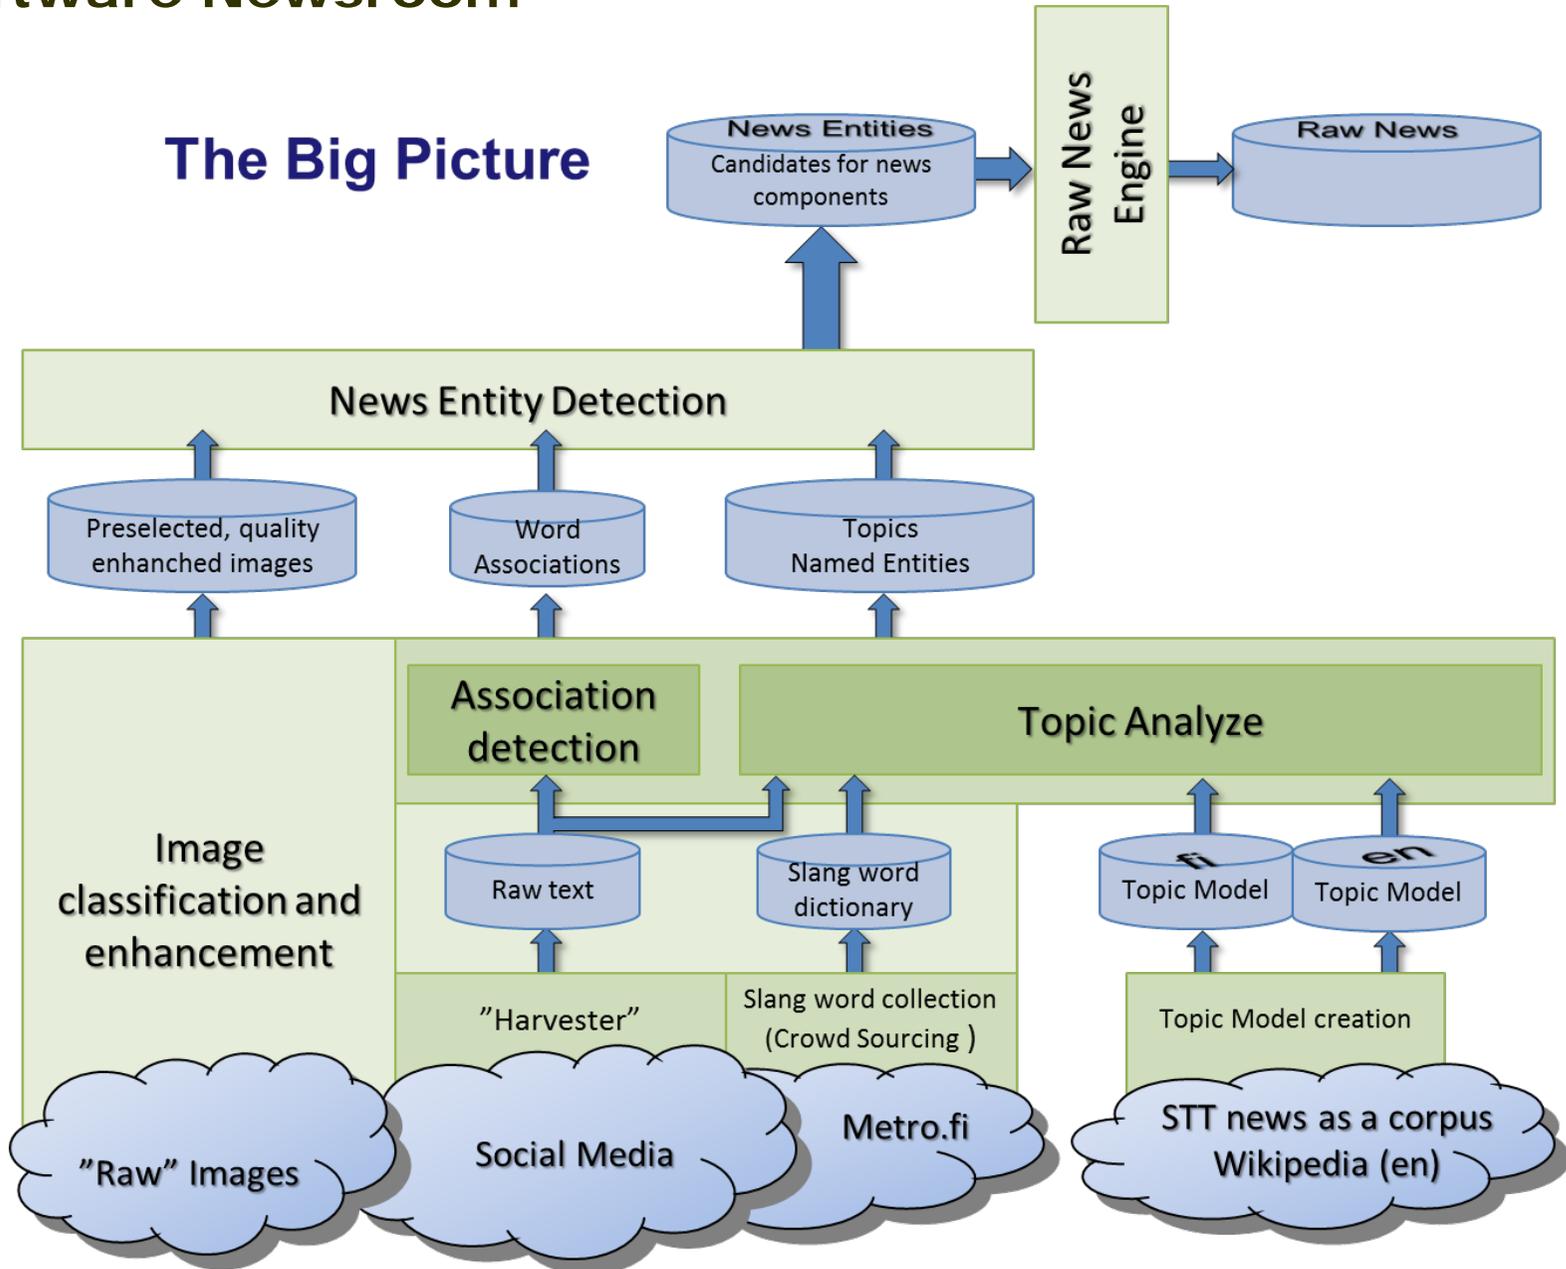

# Software Newsroom

## Vision

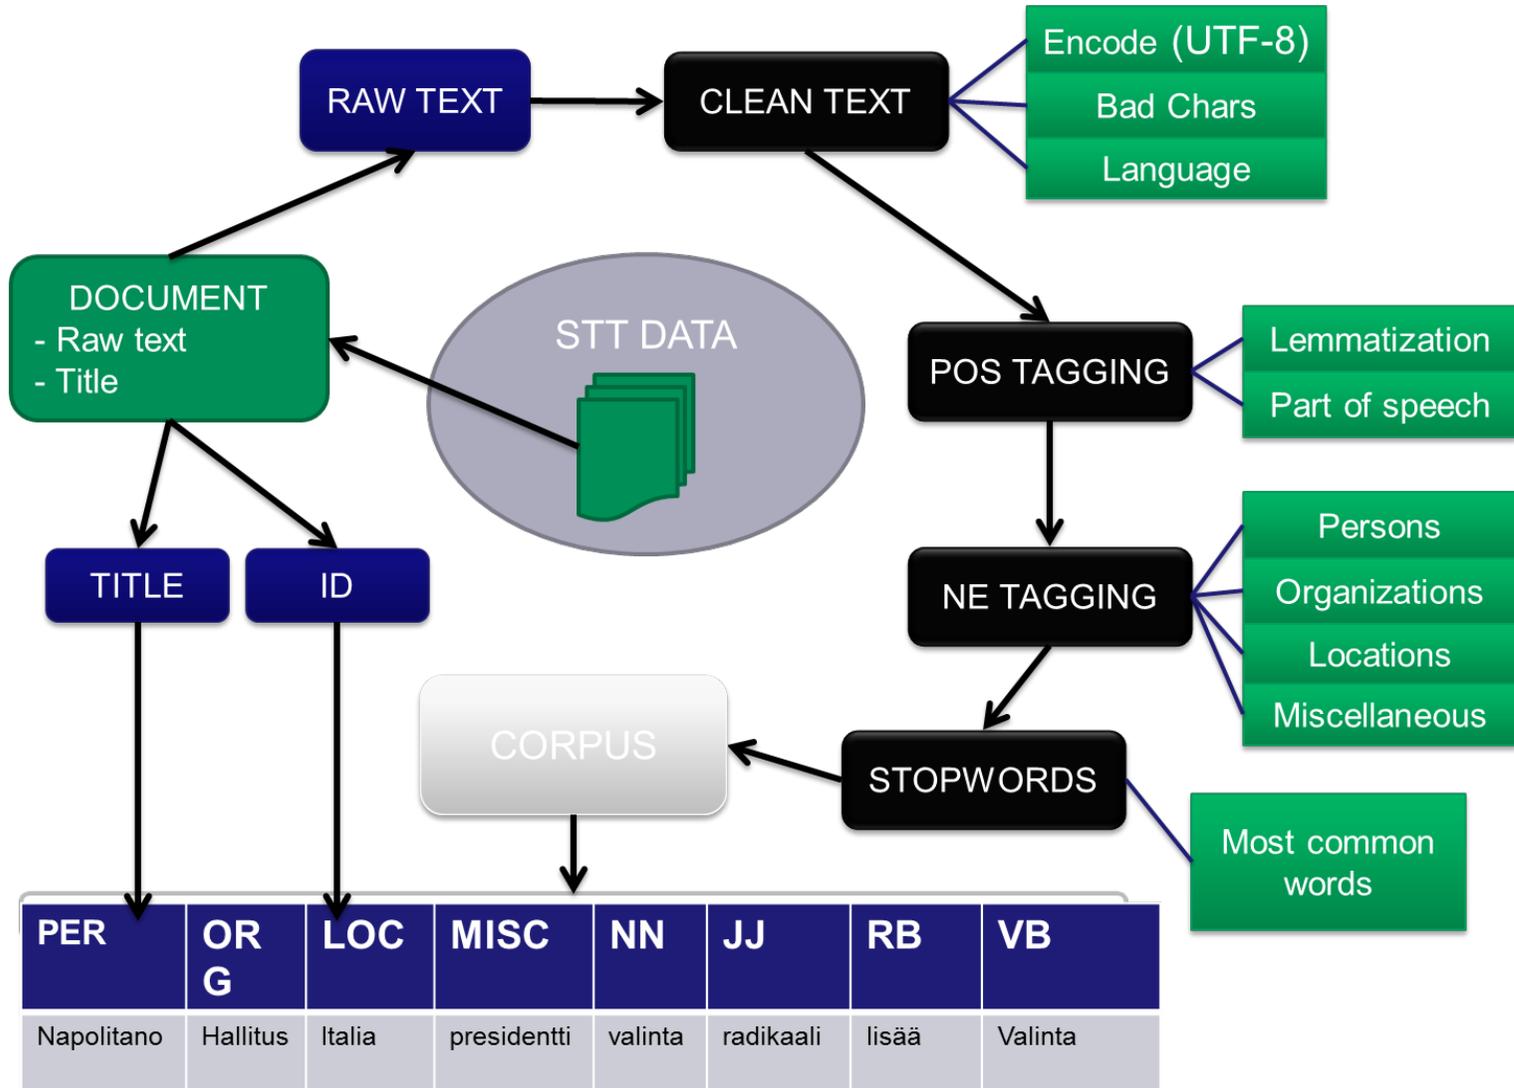

# Software Newsroom

## The Big Picture

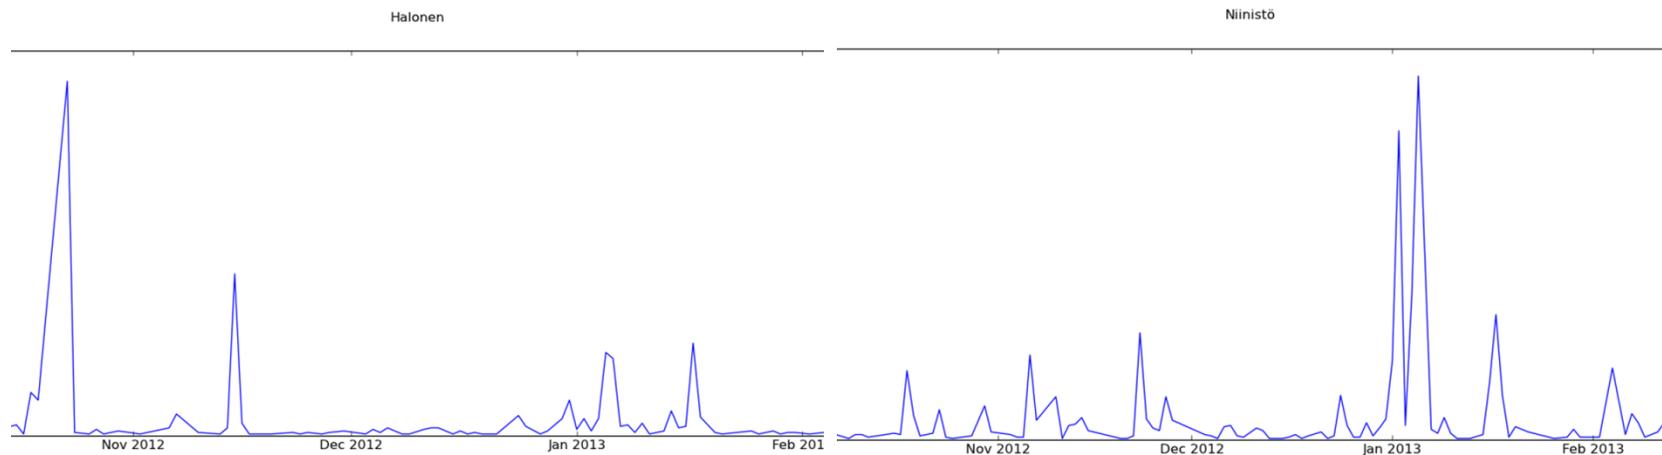

## Topic model creation

## News search

1. Projection of individual articles to a topic model to find the associated (most probable) topic and named entities = what/who is written about in each of them
2. If a topic or same named entity occurs frequently in a short time window, or the topic is otherwise interesting or anomalous (e.g. "accident"), the associated material is labeled as a "news entity candidate"
3. The candidate topic short term occurrence frequency is compared to longer term average in the chosen history, i.e. "normal" occurrence frequency
4. Significant deviation from "normal" or trend → potential news

## Software Newsroom

### Ongoing and future research

#### Improvement of topic models

- ❑ Improved Finnish corpus and named entity database
- ❑ Understanding of Finnish social media language (“slang word” dictionary)
- ❑ Iterative/hierarchical topic modelling and analysis
  - e.g. sports → football, ice hockey, volleyball, golf, ...
- ❑ English and Swedish corpora and named entities

#### Combining of topic mining and association search

- ❑ Improvement of the efficiency and quality of news search

#### How much the editing of news can be automated ?

- ❑ Investigation of methods for automated authoring of news articles from unstructured data (i.e. raw news entities)

## Business ideas and commercialization prospects

- 2General has been developing and iterating on various approaches for commercialization of the Software Newsroom results
  - Integration of the Software Newsroom technology to a complete in-house developed publishing solution that would add a new category of articles based on data gathered from social media
  - Standalone social media analysis software that would allow mining the social media data collected and analyzed with the Software Newsroom technology
  - Hyperlocal news publishing platform that would allow a local media publisher to operate a profitable online business with one journalist only
  - Mobile application that allows freelance journalists to manage their multi platform publishing workflow from start to end
  - Several spinoff projects utilizing the media insight gathered in the project, especially in the field of newsroom operations automation
